1. Abstract

The analysis and design of microwave circuits incorporating passive elements requires suitable equivalent circuit models that can be used to properly represent the components in CAD programs, including their parasitic effects, in the frequency range of interest. Ideally, these models should be as simple as possible and based on basic lumped elements whenever possible. We present here the models obtained in our laboratory for several types of small size (0102, 0202 and 0302) chip resistors of the type used for bonding in cryogenic microwave amplifiers. The resistors were manufactured by SOTA (State of the Art, Inc.), Compex and US Microwaves. This report is an update of IT-CDT 2020-15 to include new data of US Microwaves resistors which will be used to substitute Compex equivalents (no longer available).

2. Introduction

In addition to the inductance of the connecting bonding wires, the small chip resistors used in cryogenic amplifiers present some parasitic elements which limit their performance. These parasitics depend on the size, layout and dielectric material used. The results of five different resistors are presented in this document. They are typical examples of thick and thin film types deposited on alumina and fused quartz substrates. The equivalent circuit has been obtained by comparison with the experimental measurements of the S parameters in a configuration that mimics the typical assembly method used in the amplifiers. The chip resistors are mounted on a copper plate and connected with short bonding wires to coplanar to microstrip transitions (figure 2) on both sides. The measurements were carried out in the 0.250-110 GHz frequency range at ambient temperature using a coplanar probe station.

3. Equipment

- Probe station mod. MPS 150 (Cascade Microtech)
- Coplanar probes mod. ACP 110-A-GSG-125 (Cascade Microtech)
- Vector network analyzer mod. PNA-X 5247 (Keysight)
- Millimeter wave controller mod. N5261A (Keysight)
- Millimeter wave heads mod. N5250CX10 (Keysight)
- Transitions from coplanar to microstrip mod. ProbePoint 0503 (Jmicro)
- Coplanar calibration substrate (ISS) mod. 104-783A (Cascade Microtech)

4. Calibration

The chip resistor measurements were obtained using a standard LRRM calibration performed with the Cascade Microtech ISS calibration substrate (Impedance Standard Substrate, figure 3) using WinCal software. With the standards used this calibration performs reasonably well in all the 250 MHz-110 GHz range sampled. It was verified with an open (probes in air) and with a long matched coplanar line (~27ps) in the ISS substrate. The ISS was used in combination with an absorbing ISS holder (SN 116-334) as recommended by Cascade.

The standard LRMM method yields a calibration referenced to the end of the coplanar probes. As the objective was to measure the resistors, the reference plane had to be shifted to the end of the coplanar-microstrip transitions. This was performed with a built-in feature of the PNA-X which allows de-embedding circuits characterized by their S-parameter files. Appendix I

contain some information of the models used to generate the S-parameter files of the transitions. Additional information can be found in a previous Technical Report¹.

5. Equivalent circuit results

The measurements were performed in the complete 250 MHz-110 GHz frequency range accessible to the measurement equipment. However, a good fit with a simple equivalent circuit could only be obtained in the 0-50 GHz range. The circuit used is presented in figure 1 and the values of the components for the different resistors are shown in table I.

The equivalent circuit fitted to the Compex resistors was intentionally forced to have the same values of the parasitic elements for all the resistances². This allows using the same CAD equivalent circuit, changing only the numerical value of one component, for different resistors. During the fitting process it became clear that some of the parasitics have different importance depending on the resistor value. For example, L_{ser} is dominant for low resistor values while C has more influence for high values.

The value of the Q of the capacitor was introduced in an unfruitful attempt to obtain a better fit at $f > 50$ GHz. In the final version its value was fixed to 1000 (almost no loss), but it could be omitted ($Q = \infty$, lossless capacitor) if desired.

During the test of the US Microwave resistors it became clear that it was necessary to include an additional element (C_{par}) in the equivalent circuit. This is particularly critical for the highest resistance values. For this reason the last equivalent circuits incorporate the new capacitor while the old were left unchanged.

Unfortunately it was not possible to find a good compromise for the equivalent circuits of the US Microwave equivalent circuits maintaining the values of the parasitic components constant for all the resistance values. The results obtained correspond to optimizations without constraints,

Figure 1: Equivalent circuit used for the resistors, including external bonding wires. The chip resistor intrinsic components are enclosed in the rectangle.

² The S parameters obtained with completely free parasitic elements are almost identical in the 50 GHz frequency range.

19. Effect of changing SOTA 0202 by COMPLEX 0102 in 4-20 GHz ESO amplifier model.

$\approx +2$ dB of gain ≈ -0.4 K of noise

3) INITIAL:

4) WITH COMPLEX 0102 RESISTORS (No tuning):

20. Conclusions

The results obtained show that a very simple circuit model for the resistors is a good approximation to the measurement up to 50 GHz, but significant differences appear at higher frequency (see example in section 18). It was not possible to fit to a simple model which could represent the component in the complete 110 GHz range measured. The new Compex 0102 quartz chip resistors show smaller parasitics than the larger SOTA alumina resistors, as can be easily seen by comparison of the S parameters of 50 Ohm resistors. The fact that the Compex parts are smaller and built on quartz substrates has a remarkable impact in the reduction of the parasitic capacitance. The effect of the parasitics may have an important influence in the performance of the amplifiers. As an example, section 19 presents the modeled effect of the substitution of all the 0202 SOTA resistors by 0102 Compex parts of the same value in a model of a wide-band amplifier (4-20 GHz ESO simple design). An overall increase of 2 dB in gain and a reduction of 0.4 K in noise was observed, although the amplifier may need a re-optimization to perform a fair comparison.

Performance Specifications

Typical Complex commercial testing includes 100% visual, mechanical, resistance, short time overload, and Resistance Temperature Characteristic. Our parts also meet or exceed additional MIL-PRF-55342 and MIL-STD-202 requirements outlined in the table at left. Please consult the factory for your exact testing requirements.

Higher power ratings, additional sizes, and custom resistors available. Please contact factory to request free samples.

R Series

Thin Film Resistors – Single or Dual Edge Wrap

Compex's line of wire-bondable and edge-terminated thin film resistors offers our customers significant flexibility to meet the most challenging designs. Built to the customer's exact specifications, available alternatives include single, dual, center-tap, array, and custom configurations. Standard and microwave frequency options up to 40 GHz or higher are available, voltage rating up to 100V.

- CUSTOM MANUFACTURED TO PROVIDE THE OPTIMUM PART FOR EACH APPLICATION
- ALUMINA, ALUMINUM NITRIDE AND BERYLLIUM OXIDE
- TOLERANCE DOWN TO 0.01%

R Part Number Assembly

Resistance to Bonding Exposure	±0.25%	±0.25%	±0.25%

Part Number

M55342K13W100DS -W

Packaging: -TR: Tape & Reel -W: Waffle Tray									
Product Level (/1000 hrs.): M: 1% P: 0.1% R & U: 0.01% S & V: 0.001% T: Space 0.001%									
Resistance Value and Tolerance: Three numerals and a letter indicating decimal, value range, and tolerance					Ω: D: 1% G: 2% J: 5% M: 10% kΩ: E: 1% H: 2% K: 5% N: 10% MΩ: F: 1% T: 2% L: 5% P: 10%				
Termination Material: W: Wire Bondable Gold									
Size: 13: RM0302									
Temperature Characteristic (ppm/°C): K: ±100 L: ±200 M: ±300									

Performance Specification MIL-PRF-55342

Performance Specification MIL-PRF-55342

Mechanical

	Inches	Millimeters
Length (a)	.032(.030 - .034)	0.81(0.76 - 0.86)
Width (b)	.022(.020 - .024)	0.56(0.51 - 0.61)
Thickness (c)	.015(.010 - .020)	0.38(0.25 - 0.51)
Top Termination (d)	.006(.004 - .008)	0.15(0.10 - 0.20)

Approximate Weight 0.00055 g

US MICROWAVES

Advanced Microwave Components

0.38mW 251.91GHz QUARTZ MICROWAVE THIN
FILM RESISTORS
**USM RQ1020T10-251.91GHz-
0.38mW**

FEATURES

Wide resistance range 0.1 Ω to 91K Ω
Good TCR tracking
Very low capacitance value
Available in die form and shipped in waffle packs

APPLICATIONS

Biasing discrete transistors circuits
Feedback resistors for amplifiers
Chip & wire hybrid circuits
Surface mount circuits
Transimpedance amplifiers
Optical communication receivers

QUARTZ RESISTOR

SHORT PRODUCT APPLICATION NOTE

The RQ1020T10 quartz series of microwave thin film chip resistors is designed to be used in microwave hybrid circuits for biasing of active components and as feedback resistors for high speed transimpedance amplifiers. To attain very low capacitance to ground, these chip resistors are manufactured on quartz substrates and do not have backside metallization.

These devices can be used over the full military temperature range -55°C to +125°C. Quality and workmanship is per MIL-STD-883. Devices are 100% tested, visual inspected and packaged in waffle packs. US Microwaves employs proprietary thin film technologies for deposition of a wide range of sheet resistance films from 1 Ω /sq to 10,000 Ω /sq.

Custom lab kits are available: [RQ1020T10 Lab kit](#)

TECHNOLOGY DESCRIPTION: SEMICONDUCTOR-THIN FILM MANUFACTURING

All thin film microwave products are manufactured using advanced semiconductors and thin film technologies including ultra-stable and self passivating Tantalum Nitride resistors, gold interconnect metallization and reliable MNOS capacitors to achieve excellent uniformity, performance and reliability. Thin film technology is the preferred solution for all applications that require low noise, long term stability and excellent performance at very high frequencies. US Microwaves employs proprietary thin film technologies for deposition of a wide range of resistive films with sheet resistance films from 1 Ω /sq to 10,000 Ω /sq. All US Microwaves products are available in die form and are ideal for high reliability hybrid and multi chip module applications.

All US Microwaves products are manufactured using [GOLDCHIP TECHNOLOGY™](#) a trade mark of [Semiconix Corporation](#).

ELECTRICAL CHARACTERISTICS

PARAMETER	VALUE	UNITS
Resistance range	1 to 1E6	Ω
Maxim Power	0.38	mW
Maxim Capacitance	0.013	pF
RC constant (defined for 50 Ω resistance)	0.63	ps
3dB frequency (defined for selected 50 Ω resistance)	251.91	GHz
Temperature Coefficient -55°C to 150°C	75	ppm/deg C
Tolerances available	1, 5	%
Operating Temperature range	-65 to 200	°C
Working voltage (Vw)	4.4	V
Peak voltage at 25C, 5 sec	6.2	V
Insulation resistance at 25 C	3.E+12	Ω

ONLY Proper die handling equipment and procedures should be employed. Stresses beyond listed absolute maximum ratings may cause permanent damage to the device.

GENERAL DIE INFORMATION

Substrate	Thickness (mils)	Die size (mils)	Resistor	Bonding pads	Backside metal
SiO2 - Quartz	10 $\pm$ 1	10 x 20 $\pm$ 2	The resistive material is high stability Tantalum Nitride with low temperature coefficient of resistance, <75ppm/°C typical. For Rsq<10 Ω /sq and Rsq>500 Ω /sq, the resistive material is proprietary.	The bonding pads of the resistors are min 4x4 mils, 3 μ m thick, 99.99% electroplated gold with a TiW barrier that withstands 30 min at 400°C in air without loss of adhesion.	The backside of the die is NOT metallized. Standard TiW/Au or other custom metallizations are available upon special request.

All US Microwaves products are available in die form. Typical delivery for die products is 2-3 weeks ARO. For Custom designs, delivery is 3-4 weeks ARO. Certain items may be available from stock. Inventory is periodically updated. All devices for chip and wire applications are 100% tested, visual inspected and shipped in waffle packs (WP). For high volume automated assembly, MTR chip resistors (5% and 10% tolerance only) are supplied as 4" wafers 100% tested, inked and diced on expanded film frame (FF).

DIE LAYOUT - MECHANICAL SPECIFICATIONS

STANDARD PRODUCTS ORDERING INFORMATION

RQ1020T10-500-1%-WP

Note1: The first 3 digits are significant figures and the last digit specifies the number of zeros to follow (10 exponent), i.e. (nnn) $\times 10^M$. If less than 4 digits, it means the absolute value, and it might include decimal point.
Note2: For different values than listed on P/N Builder above (standard EIA E192), please use the RFQ link located on the bottom of this page.
